# Press Release

## A label without the label

**Syracuse, NY April 29, 2008:** Thermopatch proudly introduces a new innovation called the Thermo Trans System. The Thermo Trans System gives individual Garment manufacturers, screen-printers and promotional item sellers the chance to create, print and heat-seal their own care label in-house. This is a significant development that will speed up manufacturing, save money, and reduce the minimum orders of tag free labels to as little as one label at a time.

Before the Thermo Trans System, you would have to place an order for transfers that were pre-made; they may take weeks for delivery and chances are you would have to buy a minimum that is more than you requested.

The system is very simple to use; it is made up of a thermal printer, software, a heat-seal machine and the label and ink media. First you design the label in the software; the label can include bar codes, logos and variable numbers and text. Next load the media and then press print. The thermal printer (a4-2) is equipped with a cutter that cuts it to the size you specify and drops it ready to be heat-sealed. Lastly, place the garments on the lower heat-seal platen, put the label face down, and heat-seal for 5 seconds.

Thermopatch provides textile/garment identification; marking equipment, heat-seal machines, mending products, and a variety of supporting supplies to the laundry industry and garment/textile manufacturers worldwide.
